In the Cold Chain Industry, **hefty fines** from clients due to **delays** in shipment are a significant concern.

Such delays may happen due to **inaccurately scheduled appointments** where drivers end up waiting several **hours** for their turn, leading to a delay.

02

Such a **problem** can be **solved** with an **accurate appointment scheduler.** It can help a cold chain logistics provider **plan** their staffing and schedule appointments based on drivers' **arrival and departure** history, routes, and delivery times.

An intelligent appointment scheduler can **predict** and **automatically** book accurate appointments and give a **slot** to the driver on which only they will be served, nobody else.

When **implemented**, such a predictive solution can solve the problem of shipment delays.
